SEX LIFE OF AN ELECTRON

One night when his charge was pretty high, Micro-Farad decided to seek out a cute coil to help him discharge. He picked up Milli-Amp and took her for a ride on his Megacycle. Then he rode across the Wheatstone Bridge, around the Sine Wave, and stopped in the Magnetic Field by the flowing stream.

Micro-Farad, attracted by Milli-Amp's characteristic curves, soon had her fully charged. He laid her on the ground potential, raised her frequency and lowered her resistance.

He pulled out his high voltage probe and inserted it into her socket, connecting them in parallel, and began to short circuit her resistance shunt; fully excited, Milli-Amp mumbled, "Ohm, Ohm, Ohm".

With his tube operating at maximum, and her field oscillating, his current flow caused her shunt to overheat and Micro-Farad was rapidly discharging, drawing off every electron.

They fluxed all night trying various connections and sockets until his magnet had soft core and lost all its field strength.

Afterwards, Milli-Amp tried self-inductance and damaged her solenoids. With her battery discharged, Micro-Farad was unable to excite her field, so they spent the rest of the night reversing polarity and blowing each other's fuses.
